

OpenCore

Reference Manual (~~0.7.9~~0.8.0)

[2022.04.04]

Requirement: 10.4

Description: Disables primary checksum (0x58-0x59) writing in AppleRTC.

Note 1: This option will not protect other areas from being overwritten, see RTCMemoryFixup kernel extension if this is desired.

Note 2: This option will not protect areas from being overwritten at firmware stage (e.g. macOS bootloader), see AppleRtcRam protocol description if this is desired.

9. ExtendBTFeatureFlags

Type: plist boolean

Failsafe: false

Requirement: 10.8-11

Description: Set FeatureFlags to 0x0F for full functionality of Bluetooth, including Continuity.

Note: This option is a substitution for BT4LEContinuityFixup.kext, which does not function properly due to late patching progress.

10. ExternalDiskIcons

Type: plist boolean

Failsafe: false

Requirement: 10.4

Description: Apply icon type patches to AppleAHCIPort.kext to force internal disk icons for all AHCI disks.

Note: This option should be avoided whenever possible. Modern firmware typically have compatible AHCI controllers.

11. [ForceAquantiaEthernet](#)

[Type: plist boolean](#)

[Failsafe: false](#)

[Requirement: 10.15.4](#)

[Description: Enable Aquantia AQtion AQC-107s based 10GbE network cards support.](#)

[This option enables Aquantia AQtion AQC-107s based 10GbE network cards support, which used to work natively before macOS 10.15.4.](#)

[Note: In order for Aquantia cards to properly function, DisableIoMapper must be disabled, DMAR ACPI table must not be dropped, and VT-d must be enabled in BIOS.](#)

12. ForceSecureBootScheme

Type: plist boolean

Failsafe: false

Requirement: 11

Description: Force x86 scheme for IMG4 verification.

Note: This option is required on virtual machines when using SecureBootModel different from x86legacy.

13. IncreasePciBarSize

Type: plist boolean

Failsafe: false

Requirement: 10.10

Description: Allows IOPCIFamily to boot with 2 GB PCI BARs.

Normally macOS restricts PCI BARs to 1 GB. Enabling this option (still) does not let macOS actually use PCI devices with larger BARs.

Note: This option should be avoided whenever possible. A need for this option indicates misconfigured or defective firmware.

14. LpicKernelPanic

Type: plist boolean

Failsafe: false

Requirement: 10.6 (64-bit)

Description: Disables kernel panic on LAPIC interrupts.

higher blocks. The outcome is that trimming on such SSDs will be non-functional soon after installation, resulting in additional wear on the flash.

One way to workaround the problem is to increase the timeout to an extremely high value, which at the cost of slow boot times (extra minutes) will ensure that all the blocks are trimmed. ~~Set~~ Setting this option to a high value, such as 4294967295 ~~, to ensure ensures~~ that all blocks are trimmed. Alternatively, use over-provisioning, if supported, or create a dedicated unmapped partition where the reserve blocks can be found by the controller. Conversely, the trim operation can be mostly disabled by setting a very low timeout value ~~, e.g. 999,~~ while 0 entirely disables it. Refer to this article for details.

On macOS 12+ *Note:* The failsafe value -1 indicates that this patch will not be applied, such that apfs.kext will remain untouched.

Note 2: On macOS 12.0 and above, it is no longer possible to ~~set trim timeout for APFS filesystems~~ specify trim timeout. However, ~~trim it~~ can be disabled ~~when the timeout value is set to~~ by setting 0.

Note 3: Trim operations are *only* affected at booting phase when the startup volume is mounted. Either specifying timeout, or completely disabling trim with 0, will not affect normal macOS running.

20. ThirdPartyDrives

Type: plist boolean

Failsafe: false

Requirement: 10.6 (not required for older)

Description: Apply vendor patches to IOAHCIBlockStorage.kext to enable native features for third-party drives, such as TRIM on SSDs or hibernation support on 10.15 and newer.

Note: This option may be avoided on user preference. NVMe SSDs are compatible without the change. For AHCI SSDs on modern macOS version there is a dedicated built-in utility called `trimforce`. Starting from 10.15 this utility creates `EnableTRIM` variable in `APPLE_BOOT_VARIABLE_GUID` namespace with 01 00 00 00 value.

21. XhciPortLimit

Type: plist boolean

Failsafe: false

Requirement: 10.11 (not required for older)

Description: Patch various kexts (AppleUSBXHCI.kext, AppleUSBXHCIPCI.kext, IOUSBHostFamily.kext) to remove USB port count limit of 15 ports.

Note: This option should be avoided whenever possible. USB port limit is imposed by the amount of used bits in locationID format and there is no possible way to workaround this without heavy OS modification. The only valid solution is to limit the amount of used ports to 15 (discarding some). More details can be found on AppleLife.ru.

7.9 Scheme Properties

These properties are particularly relevant for older macOS operating systems. Refer to the Legacy Apple OS section for details on how to install and troubleshoot such macOS installations.

1. CustomKernel

Type: plist boolean

Failsafe: false

Description: Use customised kernel cache from the `Kernels` directory located at the root of the ESP partition.

Unsupported platforms including `Atom` and `AMD` require modified versions of XNU kernel in order to boot. This option provides the possibility to using a customised kernel cache which contains such modifications from ESP partition.

2. FuzzyMatch

Type: plist boolean

Failsafe: false

Description: Use `kernelcache` with different checksums when available.

On macOS 10.6 and earlier, `kernelcache` filename has a checksum, which essentially is `adler32` from SMBIOS product name and EfiBoot device path. On certain firmware, the EfiBoot device path differs between UEFI and macOS due to ACPI or hardware specifics, rendering `kernelcache` checksum as always different.

- Options will be listed in file system handle firmware order to maintain an established order across reboots regardless of the operating system chosen for loading.
- Custom entries, tools, and system entries will be added after all other options.
- Auxiliary options will only be displayed upon entering “Extended Mode” in the OpenCore picker (typically by pressing the **Space** key).

The boot process is as follows:

- Look up the first valid primary option in the **BootNext** UEFI variable.
- On failure, look up the first valid primary option in the **BootOrder** UEFI variable.
- Mark the option as the default option to boot.
- Boot option through the picker or without it depending on the **ShowPicker** option.
- Show picker on failure otherwise.

Note 1: This process will only work reliably when the **RequestBootVarRouting** option is enabled or the firmware does not control UEFI boot options (**OpenDuetPkg** or custom BDS). When **LauncherOption** is not enabled, other operating systems may overwrite OpenCore settings and this property should therefore be enabled when planning to use other operating systems.

Note 2: UEFI variable boot options boot arguments will be removed, if present, as they may contain arguments that can compromise the operating system, which is undesirable when secure boot is enabled.

Note 3: Some operating systems, such as Windows, may create a boot option and mark it as the topmost option upon first boot or after NVRAM resets from within OpenCore. When this happens, the default boot entry choice will remain changed until the next manual reconfiguration.

8.2 Properties

1. Boot

Type: plist dict

Description: Apply the boot configuration described in the Boot Properties section below.

2. BlessOverride

Type: plist array

Failsafe: Empty

Description: Add custom scanning paths through the bless model.

To be filled with **plist string** entries containing absolute UEFI paths to customised bootloaders such as `\EFI\debian\grubx64.efi` for the Debian bootloader. This allows non-standard boot paths to be automatically discovered by the OpenCore picker. Designwise, they are equivalent to predefined blessed paths, such as `\System\Library\CoreServices\boot.efi` or `\EFI\Microsoft\Boot\bootmgfw.efi`, but unlike predefined bless paths, they have the highest priority.

3. Debug

Type: plist dict

Description: Apply debug configuration described in the Debug Properties section below.

4. Entries

Type: plist array

Failsafe: Empty

Description: Add boot entries to OpenCore picker.

To be filled with **plist dict** values, describing each load entry. Refer to the Entry Properties section below for details.

5. Security

Type: plist dict

Description: Apply the security configuration described in the Security Properties section below.

6. Serial

Type: plist dict

Description: Configure PCD values required by `BaseSerialPortLib16550` for serial ports to properly function. Values are listed and described in the [Serial Properties section below](#).

[This section overrides the PCD values listed in BaseSerialPortLib16550.inf. Refer to MdeModulePkg.dec for the explanations of each key.](#)

7. Tools

Type: plist array

Failsafe: Empty

Description: Add tool entries to the OpenCore picker.

To be filled with `plist dict` values, describing each load entry. Refer to the Entry Properties section below for details.

Note: Certain UEFI tools, such as UEFI Shell, can be very dangerous and **MUST NOT** appear in production configurations, particularly in vaulted configurations as well as those protected by secure boot, as such tools can be used to bypass the secure boot chain. Refer to the UEFI section for examples of UEFI tools.

8.3 Boot Properties

1. ConsoleAttributes

Type: plist integer

Failsafe: 0

Description: Sets specific attributes for the console.

The text renderer supports colour arguments as a sum of foreground and background colours based on the UEFI specification. The value for black background and for black foreground, 0, is reserved.

List of colour values and names:

- 0x00 — EFI_BLACK
- 0x01 — EFI_BLUE
- 0x02 — EFI_GREEN
- 0x03 — EFI_CYAN
- 0x04 — EFI_RED
- 0x05 — EFI_MAGENTA
- 0x06 — EFI_BROWN
- 0x07 — EFI_LIGHTGRAY
- 0x08 — EFI_DARKGRAY
- 0x09 — EFI_LIGHTBLUE
- 0x0A — EFI_LIGHTGREEN
- 0x0B — EFI_LIGHTCYAN
- 0x0C — EFI_LIGHTRED
- 0x0D — EFI_LIGHTMAGENTA
- 0x0E — EFI_YELLOW
- 0x0F — EFI_WHITE
- 0x10 — EFI_BACKGROUND_BLACK
- 0x11 — EFI_BACKGROUND_BLUE
- 0x12 — EFI_BACKGROUND_GREEN
- 0x13 — EFI_BACKGROUND_CYAN
- 0x14 — EFI_BACKGROUND_RED
- 0x15 — EFI_BACKGROUND_MAGENTA
- 0x16 — EFI_BACKGROUND_BROWN
- 0x17 — EFI_BACKGROUND_LIGHTGRAY

Note: This option may not work well with the **System** text renderer. Setting a background different from black could help with testing GOP functionality.

2. HibernateMode

Type: plist string

Failsafe: None

Description: Hibernation detection mode. The following modes are supported:

- **None** — Ignore hibernation state.
- **Auto** — Use RTC and NVRAM detection.

(bundled with OpenCore) may be used to partially recover the stacktrace.

Development and debug kernels produce more useful kernel panic logs. Consider downloading and installing the `KernelDebugKit` from developer.apple.com when debugging a problem. To activate a development kernel, the boot argument `kcsuffix=development` should be added. Use the `uname -a` command to ensure that the current loaded kernel is a development (or a debug) kernel.

In cases where the OpenCore kernel panic saving mechanism is not used, kernel panic logs may still be found in the `/Library/Logs/DiagnosticReports` directory.

Starting with macOS Catalina, kernel panics are stored in JSON format and thus need to be preprocessed before passing to `kpdescribe.sh`:

```
cat Kernel.panic | grep macOSProcessedStackshotData |  
python -c 'import json,sys;print(json.load(sys.stdin)["macOSPanicString"])-'  
python3 -c 'import json,sys;print(json.load(sys.stdin)["macOSPanicString"])-'
```

3. DisableWatchDog

Type: plist boolean

Failsafe: false

Description: Some types of firmware may not succeed in booting the operating system quickly, especially in debug mode. This results in the watchdog timer aborting the process. This option turns off the watchdog timer.

4. DisplayDelay

Type: plist integer

Failsafe: 0

Description: Delay in microseconds executed after every printed line visible onscreen (i.e. console).

5. DisplayLevel

Type: plist integer, 64 bit

Failsafe: 0

Description: EDK II debug level bitmask (sum) showed onscreen. Unless **Target** enables console (onscreen) printing, onscreen debug output will not be visible.

The following levels are supported (discover more in `DebugLib.h`):

- 0x00000002 (bit 1) — `DEBUG_WARN` in `DEBUG`, `NOOPT`, `RELEASE`.
- 0x00000040 (bit 6) — `DEBUG_INFO` in `DEBUG`, `NOOPT`.
- 0x00400000 (bit 22) — `DEBUG_VERBOSE` in custom builds.
- 0x80000000 (bit 31) — `DEBUG_ERROR` in `DEBUG`, `NOOPT`, `RELEASE`.

6. LogModules

Type: plist string

Failsafe: *

Description: Filter log entries by module.

This option filters logging generated by specific modules, both in the log and onscreen. Two modes are supported:

- + — Positive filtering: Only present selected modules.
- - — Negative filtering: Exclude selected modules.

When multiple ones are selected, comma (,) should be used as the splitter. For instance, `+OCCPU,OCA,OCB` means *only* `OCCPU`, `OCA`, `OCB` being printed, while `-OCCPU,OCA,OCB` indicates these modules being filtered out (i.e. *not* logged). When no symbol is specified, positive filtering (+) will be used. * indicates all modules being logged.

Note 1: Acronyms of libraries can be found in the **Libraries** section below.

Note 2: Messages printed before the configuration of log protocol cannot be filtered.

7. ~~SerialInitType: plist boolean~~~~Failsafe: false~~~~Description: Perform serial port initialisation.~~

~~This option will perform serial port initialisation within OpenCore prior to enabling (any) debug logging. Serial port configuration is defined via PCDs at compile time in gEfiMdeModulePkgTokenSpaceGuid GUID.~~

~~Default values as found in MdeModulePkg.dec are as follows:~~

- ~~PcdSerialBaudRate~~ — ~~Baud rate: 115200.~~
- ~~PcdSerialLineControl~~ — ~~Line control: no parity, 8 data bits, 1 stop bit.~~

~~Refer to the section for details.~~

8. SysReport

Type: plist boolean

Failsafe: false

Description: Produce system report on ESP folder.

This option will create a **SysReport** directory in the ESP partition unless already present. The directory will contain ACPI, SMBIOS, and audio codec dumps. Audio codec dumps require an audio backend driver to be loaded.

Note: To maintain system integrity, the **SysReport** option is **not** available in **RELEASE** builds. Use a **DEBUG** build if this option is required.

9. Target

Type: plist integer

Failsafe: 0

Description: A bitmask (sum) of enabled logging targets. Logging output is hidden by default and this option must be set when such output is required, such as when debugging.

The following logging targets are supported:

- 0x01 (bit 0) — Enable logging, otherwise all log is discarded.
- 0x02 (bit 1) — Enable basic console (onscreen) logging.
- 0x04 (bit 2) — Enable logging to Data Hub.
- 0x08 (bit 3) — Enable serial port logging.
- 0x10 (bit 4) — Enable UEFI variable logging.
- 0x20 (bit 5) — Enable **non-volatile** UEFI variable logging.
- 0x40 (bit 6) — Enable logging to file.

Console logging prints less than the other variants. Depending on the build type (**RELEASE**, **DEBUG**, or **NOOPT**) different amount of logging may be read (from least to most).

To obtain Data Hub logs, use the following command in macOS (Note that Data Hub logs do not log kernel and kext patches):

```
ioreg -lw0 -p IODeviceTree | grep boot-log | sort | sed 's/.*<\(.*\)>.*\/1/' | xxd -r -p
```

UEFI variable log does not include some messages and has no performance data. To maintain system integrity, the log size is limited to 32 kilobytes. Some types of firmware may truncate it much earlier or drop completely if they have no memory. Using the **non-volatile** flag will cause the log to be written to NVRAM flash after every printed line.

To obtain UEFI variable logs, use the following command in macOS:

```
nvrAM 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102:boot-log |
awk '{gsub(/%0d%0a%00/, ""); gsub(/%0d%0a/, "\n")}'1'
```

Warning: Certain firmware appear to have defective NVRAM garbage collection. As a result, they may not be able to always free space after variable deletion. Do not enable **non-volatile** NVRAM logging on such devices unless specifically required.

While the OpenCore boot log already contains basic version information including build type and date, this information may also be found in the **opencore-version** NVRAM variable even when boot logging is disabled.

File logging will create a file named **opencore-YYYY-MM-DD-HHMMSS.txt** (in UTC) under the EFI volume root with log contents (the upper case letter sequence is replaced with date and time from the firmware). Please be warned that some file system drivers present in firmware are not reliable and may corrupt data when writing files through UEFI. Log writing is attempted in the safest manner and thus, is very slow. Ensure that **DisableWatchDog** is set to **true** when a slow drive is used. Try to avoid frequent use of this option when dealing with flash drives as large I/O amounts may speed up memory wear and render the flash drive unusable quicker.

partition, resulting in boot failures. This is likely to be the case when an “OCB: Apple Secure Boot prohibits this boot entry, enforcing!” message is logged.

When this happens, either reinstall the operating system or copy the manifests (files with `.im4m` extension, such as `boot.efi.j137.im4m`) from `/usr/standalone/i386` to `/Volumes/Preboot/<UUID>/System/Library/CoreServices`. Here, `<UUID>` is the system volume identifier. On HFS+ installations, the manifests should be copied to `/System/Library/CoreServices` on the system volume.

For more details on how to configure Apple Secure Boot with UEFI Secure Boot, refer to the UEFI Secure Boot section.

8.6 Serial Properties

1. BaudRate

Type: plist integer

Failsafe: 115200

Description: Set the baud rate for serial port.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialBaudRate` defined in `MdeModulePkg.dec`.

2. ClockRate

Type: plist integer

Failsafe: 1843200

Description: Set the clock rate for serial port.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialClockRate` defined in `MdeModulePkg.dec`.

3. ExtendedTxFifoSize

Type: plist integer

Failsafe: 64

Description: Set the extended transmit FIFO size for serial port.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialExtendedTxFifoSize` defined in `MdeModulePkg.dec`.

4. FifoControl

Type: plist integer

Failsafe: 0x07

Description: Configure serial port FIFO Control settings.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialFifoControl` defined in `MdeModulePkg.dec`.

5. Init

Type: plist boolean

Failsafe: false

Description: Perform serial port initialisation. When this option is set to `false`, no keys from this section will be overridden.

This option will perform serial port initialisation within OpenCore prior to enabling (any) debug logging.

Refer to the [Debugging](#) section for details.

6. LineControl

Type: plist integer

Failsafe: 0x07

Description: Configure serial port Line Control settings.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialLineControl` defined in `MdeModulePkg.dec`.

7. PciDeviceInfo

Type: plist data

Failsafe: 0xFF

Description: Set PCI serial device information.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialPciDeviceInfo` defined in `MdeModulePkg.dec`.

8. **RegisterAccessWidth**

Type: plist integer

Failsafe: 8

Description: Set serial port register access width.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialRegisterAccessWidth` defined in `MdeModulePkg.dec`.

9. **RegisterBase**

Type: plist integer

Failsafe: 0x03F8

Description: Set the base address of serial port registers.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialRegisterBase` defined in `MdeModulePkg.dec`.

10. **RegisterStride**

Type: plist integer

Failsafe: 1

Description: Set the serial port register stride in bytes.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialRegisterStride` defined in `MdeModulePkg.dec`.

11. **UseHardwareFlowControl**

Type: plist boolean

Failsafe: false

Description: Enable serial port hardware flow control.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialUseHardwareFlowControl` defined in `MdeModulePkg.dec`.

12. **UseMmio**

Type: plist boolean

Failsafe: false

Description: Indicate whether the serial port registers are in MMIO space.

This option will override the value of `gEfiMdeModulePkgTokenSpaceGuid.PcdSerialUseMmio` defined in `MdeModulePkg.dec`.

8.7 Entry Properties

1. **Arguments**

Type: plist string

Failsafe: Empty

Description: Arbitrary ASCII string used as boot arguments (load options) of the specified entry.

2. **Auxiliary**

Type: plist boolean

Failsafe: false

Description: Set to `true` to hide this entry when `HideAuxiliary` is also set to `true`. Press the **Spacebar** key to enter “Extended Mode” and display the entry when hidden.

3. **Comment**

Type: plist string

Failsafe: Empty

Description: Arbitrary ASCII string used to provide a human readable reference for the entry. Whether this value is used is implementation defined.

Older boards like ICH6 may not always have HPET setting in the firmware preferences, this option tries to force enable it.

2. **EnableVectorAcceleration**

Type: plist boolean

Failsafe: false

Description: Enable AVX vector acceleration of SHA-512 and SHA-384 hashing algorithms.

[Note: This option may cause issues on certain laptop firmwares, including Lenovo.](#)

3. **EnableVmx**

Type: plist boolean

Failsafe: false

Description: Enable Intel virtual machine extensions.

Note: Required to allow virtualization in Windows on some Mac hardware. VMX is enabled or disabled and locked by BIOS before OpenCore starts on most firmware. Use BIOS to enable virtualization where possible.

4. **DisableSecurityPolicy**

Type: plist boolean

Failsafe: false

Description: Disable platform security policy.

Note: This setting disables various security features of the firmware, defeating the purpose of any kind of Secure Boot. Do NOT enable if using UEFI Secure Boot.

5. **ExitBootServicesDelay**

Type: plist integer

Failsafe: 0

Description: Adds delay in microseconds after EXIT_BOOT_SERVICES event.

This is a very rough workaround to circumvent the **Still waiting for root device** message on some APTIO IV firmware (ASUS Z87-Pro) particularly when using FileVault 2. It appears that for some reason, they execute code in parallel to EXIT_BOOT_SERVICES, which results in the SATA controller being inaccessible from macOS. A better approach is required and Acidanthera is open to suggestions. Expect 3 to 5 seconds to be adequate when this quirk is needed.

6. **ForceOcWriteFlash**

Type: plist boolean

Failsafe: false

Description: Enables writing to flash memory for all OpenCore-managed NVRAM system variables.

Note: This value should be disabled on most types of firmware but is left configurable to account for firmware that may have issues with volatile variable storage overflows or similar. Boot issues across multiple OSes can be observed on e.g. Lenovo Thinkpad T430 and T530 without this quirk. Apple variables related to Secure Boot and hibernation are exempt from this for security reasons. Furthermore, some OpenCore variables are exempt for different reasons, such as the boot log due to an available user option, and the TSC frequency due to timing issues. When toggling this option, a NVRAM reset may be required to ensure full functionality.

7. **ForgeUefiSupport**

Type: plist boolean

Failsafe: false

Description: Implement partial UEFI 2.x support on EFI 1.x firmware.

This setting allows running some software written for UEFI 2.x firmware like NVIDIA GOP Option ROMs on hardware with older EFI 1.x firmware like MacPro5,1.

8. **IgnoreInvalidFlexRatio**

Type: plist boolean

Failsafe: false

Description: Some types of firmware (such as APTIO IV) may contain invalid values in the MSR_FLEX_RATIO (0x194) MSR register. These values may cause macOS boot failures on Intel platforms.

Why do I see Basic data partition in the Boot Camp Startup Disk control panel?

The Boot Camp control panel uses the GPT partition table to obtain each boot option name. After installing Windows separately, the partition has to be relabelled manually. This can be done with many utilities including the open-source gdisk utility. Reference example:

```
PS C:\gdisk> .\gdisk64.exe \\.\\physicaldrive0
```

```
GPT fdisk (gdisk) version 1.0.4
```

```
Command (? for help): p
```

```
Disk \\.\\physicaldrive0: 419430400 sectors, 200.0 GiB
```

```
Sector size (logical): 512 bytes
```

```
Disk identifier (GUID): DEC57EB1-B3B5-49B2-95F5-3B8C4D3E4E12
```

```
Partition table holds up to 128 entries
```

```
Main partition table begins at sector 2 and ends at sector 33
```

```
First usable sector is 34, last usable sector is 419430366
```

```
Partitions will be aligned on 2048-sector boundaries
```

```
Total free space is 4029 sectors (2.0 MiB)
```

| Number | Start (sector) | End (sector) | Size | Code | Name |
|--------|----------------|--------------|-----------|------|------------------------|
| 1 | 2048 | 1023999 | 499.0 MiB | 2700 | Basic data partition |
| 2 | 1024000 | 1226751 | 99.0 MiB | EF00 | EFI system partition |
| 3 | 1226752 | 1259519 | 16.0 MiB | 0C01 | Microsoft reserved ... |
| 4 | 1259520 | 419428351 | 199.4 GiB | 0700 | Basic data partition |

```
Command (? for help): c
```

```
Partition number (1-4): 4
```

```
Enter name: BOOTCAMP
```

```
Command (? for help): w
```

```
Final checks complete. About to write GPT data. THIS WILL OVERWRITE EXISTING PARTITIONS!!
```

```
Do you want to proceed? (Y/N): Y
```

```
OK; writing new GUID partition table (GPT) to \\.\\physicaldrive0.
```

```
Disk synchronization succeeded! The computer should now use the new partition table.
```

```
The operation has completed successfully.
```

Listing 4: Relabeling Windows volume

How do I choose Windows BOOTCAMP with custom NTFS drivers?

Third-party drivers providing NTFS support, such as NTFS-3G, Paragon NTFS, Tuxera NTFS or Seagate Paragon Driver disrupt certain macOS functionality, including the Startup Disk preference pane normally used for operating system selection. While the recommended option remains not to use such drivers as they commonly corrupt the filesystem, and prefer the driver bundled with macOS with optional write support (command or GUI), there still exist vendor-specific workarounds for their products: Tuxera, Paragon, etc.

12.4 Debugging

Similar to other projects working with hardware OpenCore supports auditing and debugging. The use of NOOPT or DEBUG build modes instead of RELEASE can produce a lot more debug output. With NOOPT source level debugging with GDB or IDA Pro is also available. For GDB check OpenCore Debug page. For IDA Pro, version 7.3 or newer is needed, and Debugging the XNU Kernel with IDA Pro may also help.

To obtain the log during boot serial port debugging can be used. Serial port debugging is enabled in Target, e.g. 0xB for onscreen with serial. To initialise serial within OpenCore use [SerialInitInit](#) configuration option [under Misc->Serial with other values properly set](#). For macOS the best choice is CP2102-based UART devices. Connect motherboard TX to USB UART RX, and motherboard GND to USB UART GND. Use `screen` utility to get the output, or download GUI software, such as CoolTerm.
